

Static-2002R

Reporting Static-2002R scores with 2009 recidivism norms (non-routine): A template for cases for which the norms for routine samples do not apply.

Prepared by A. Phenix, L. Helmus, R. K. Hanson, & D. Thornton (November 3, 2009).

Note: This template is provided as an example only. Evaluators are free to use this template, or to revise the wording as they see fit. Further information concerning the research upon which this template is based can be found at www.static99.org.

The Static-2002R is an instrument designed to assist in the prediction of sexual and violent recidivism for sex offenders. Given that Static-2002R was found to fully incorporate the relationship between age at release and sexual recidivism, whereas the original Static-2002 scale did not,¹ the developers of Static-2002 recommend that the revised version of the scale (Static-2002R) replace Static-2002 in all contexts where it is used.

Mr. XXXX scored a XX on the Static-2002R places him in the Low, Low-Moderate, Moderate, Moderate-High, or High Risk Category. The results of the Static-2002R are listed below:

Static-2002R Score Summary

Category	Sub-Score*	Possible Range		
I. Age (1 item)	x	-2	2	
II. Persistence of sexual offending (3 items)	x	0	3	
III. Deviant sexual interests (3 items)	x	0	3	
IV. Relationship to victim (2 items)	x	0	2	
V. General criminality (5 items)	x	0	3	
TOTAL SCORE =		x	-2	13

Hanson and Thornton² developed this risk assessment instrument based on follow-up studies from Canada, the United States, and the United Kingdom with a total sample size of 2,169 sexual offenders from 10 samples. Using seven replication samples (n = 2,605), Static-2002R demonstrated moderate to large

accuracy in the prediction of sexual, violent, and general recidivism.^{3,4} The Static-2002R consists of 14 items and produces estimates of relative risk based upon the number of risk factors present in any one individual. The risk factors included in the risk assessment instrument are grouped into five domains: age, persistence of sex offending, deviant sexual interests, relationship to victims, and general criminality.

Percentile data for Static-2002R scores were based on three Canadian samples ($n = 1,458$). The samples used for percentile data were considered relatively unselected groups that would be representative of the population of all adjudicated sex offenders within a given correctional system. The norms are presented as percentile ranges, reflecting the observed percentage of offenders scoring at or below a specified score. Percentiles are useful in situations where the allocation of limited resources must be made, such as for treatment, community supervision, etc. Absolute degrees of recidivism risk cannot be directly inferred from these percentile rankings. The appropriateness of applying these percentiles to sexual offenders in jurisdictions other than Canada is not known.

Compared to a representative Canadian sample of adult male sexual offenders, Mr. XXXX's Static-2002R score of xxx falls into the xxxx to xxxxx percentile. This percentile range means that cc-dd percent of sex offenders in these samples scored at or below Mr. XXXX's score. Conversely, ee-ff percent of this sample of sex offenders scored higher.

Relative risk refers to the ratio of two recidivism rates. Research has found the relative risk associated with different Static-2002R scores to be consistent even when the overall base rate of recidivism varies across samples. Information concerning relative risk was based on seven samples of sexual offenders from Canada, the United States, the United Kingdom and, Denmark ($n = 2,610$). The recidivism rate for sex offenders with the same score as Mr. XXXX would be expected to be approximately (half/two thirds) of **(FOR SCORES LOWER THAN 4)**, the same as **(FOR SCORES OF 4)**, X.X times higher than **(FOR SCORES GREATER THAN 4)** the recidivism rate of the typical sexual offender (defined as estimated median score of 4).

There have been a large number of studies examining the absolute sexual recidivism rates associated with Static-2002R scores. Hanson, Phenix, &

⁴ Hanson, R. K., Lloyd, C. D., Helmus, L., & Thornton, D. (2008). *Using multiple samples to estimate percentile ranks for actuarial risk tools: A Canadian example using Static-2002*. Unpublished manuscript.

Helmus (2009)⁵ examined seven Static-2002R replication studies (total $n = 2,605$), drawn from different countries including Canada, the United States, United Kingdom and Denmark. In these samples recidivism was defined as charges in about half of the cases and as convictions in the other half.

Although the relative risk was consistent across studies, the observed recidivism rates vary considerably across samples based on factors not measured by Static-2002R. Samples that were preselected to be high-risk/high needs (3 samples) show the highest recidivism rates, the sample preselected based on treatment need (1 sample) had intermediate recidivism rates, and routine correctional samples (3 samples) had recidivism rates substantially lower than the preselected groups. Recidivism tables were not produced for the sample preselected based on treatment need because it was the only sample in that category.

Consequently, in order to evaluate Mr. XXXX we need to consider the extent to which he resembles the typical member of the routine samples, or if he is more representative of the samples preselected for treatment or the high-risk/needs samples. The exact differences between the three samples are not fully known but the following features have been identified as characteristics of the three sample types. Note that some of these definitions are based on research with a similar scale, Static-99R.⁶

Routine Correctional Samples

This group consisted of three samples of sex offenders from Canada. These samples were relatively random (i.e., unselected) samples from a correctional system (as opposed to samples from specific institutions or subject to specific measures). In other words, they can be considered roughly representative of all adjudicated sex offenders. Some offenders in these samples would have been subsequently screened for treatment or other special measures (e.g., psychiatric admission or exceptional measures related to dangerousness), but these samples represent the full population of all offenders prior to any pre-selection processes. The recidivism norms for the unselected samples are the closest available to a hypothetical average of all offenders.

Preselected for Treatment Needs Samples

⁵ Hanson, R. K., Phenix, A., & Helmus, L. (2009, October). *Static-99(R) and Static-2002(R): How to Interpret and Report in Light of Recent Research*. Paper presented at the 28th annual Research and Treatment Conference of the Association for the Treatment of Sexual Abusers, Dallas, TX. [Samples used in these analyses are reported in more detail in: Hanson, R. K., Helmus, L., & Thornton, D. (in press). Predicting recidivism among sexual offenders: A multi-site study of Static-2002. *Law & Human Behavior*.]

⁶ Helmus, L. (2009). *Re-norming Static-99 recidivism estimates: Exploring base rate variability across sex offender samples*. Unpublished master's thesis, Carleton University, Ottawa, Ontario, Canada.

This sample of offenders was referred for sex offender specific treatment during their current incarceration. If an offender is selected for treatment but does not receive it due to bed shortages, he would still be considered preselected for treatment. It is the selection that defines this sample, not the participation in treatment. This includes referral for community sex offender treatment programs for any type of conditional release during the current incarceration or for non-custodial sentences. The quality of the treatment program, jurisdiction of the program, program structure (length or content), and the quality of the offender's participation in and completion of the program is not a consideration in the definition of this group. These factors would be taken into account by an evaluator outside of the Static-2002R assessment. This sample is defined by the presence of treatment needs. Samples were categorized in this group if the treatment program was specific to sex offenders and offenders were referred for treatment during their current incarceration. Given the overlap in dynamic risk factors between sex offenders and general offenders, it is plausible that offenders referred to other (i.e., non-sex-offender-specific) treatment programs may be similar to this group. Additionally, offenders referred for treatment during previous incarcerations could also plausibly fit in this group given that at some point they were identified as having treatment needs warranting intervention and that they subsequently reoffended.

Preselected for High-Risk/High-Needs Sample

This would include a small minority of offenders selected from routine correctional populations on the basis of risk and need factors external to Static-2002R. Offenders in this group were referred for services at forensic psychiatric facilities such as offenders referred as Mentally Disorder Sex Offenders, Sexually Violent Predators/Sexually Dangerous Persons, Not Guilty by Reason of Insanity, or for treatment of a mental disorder (sexual or otherwise). It would also include offenders referred to intensive treatment programs reserved for the highest risk offenders (not moderate intensity treatment programs, or treatment programs offered to the majority of sex offenders). Offenders identified as high risk through a quasi-judicial or administrative process examining a range of risk relevant characteristics such as sentence extensions for dangerousness (e.g., preventative or indefinite detention, treatment orders, denial of statutory release) would also be included in this group.

Non-Routine Correctional Sample

The non-routine group includes all samples of offenders preselected in some way (4 samples). It therefore combines samples preselected based on treatment need, as well as those preselected as high risk/high need. In some cases there may have been some measure of preselection and the offender would be most similar to either the preselection for treatment or pre-selection for high-risk/needs samples. If the amount of preselection is unknown and there is no strong

evidence to differentiate between preselected for treatment and preselected for high-risk/needs then the non-routine sample norms are an option to consider.

In applying the recidivism norms it is ideal to use local norms that are applicable to the group of offenders to which this offender most closely resembles. Given that these norms are not often available, the routine sample will usually reflect the most appropriate recidivism rates as they are representative of typical sex offenders in correctional systems. If an evaluator believes that the offender being assessed is not typical, then it may be appropriate to use the recidivism rates from samples pre-selected for treatment, high-risk/needs, or the non-routine norms. Using any of the non-routine or preselected norms, however, requires justification.

Mr. XXXX scored a XX on the Static-2002R. Offenders with the same score as Mr. XXXX from the routine/preselected high risk and needs/non-routine samples have been found to sexually reoffend at a rate of XXXX percent in five years and XXXX percent in ten years.

The justification for using the recidivism rates from the preselected high risk and needs/non-routine samples is as follows:
